Fuel injection is the introduction of fuel in an internal combustion engine, most commonly automotive engines, by the means of an injector. This article focuses on fuel injection in reciprocating piston and rotary piston engines. All diesel (compression-ignition) engines use fuel injection, and many Otto (spark-ignition) engines use fuel injection of one kind or another.

Fuel injection systems have a significant influence on the combustion process and hence a key role to play in improving engine fuel consumption and reducing noxious exhaust emissions. The following characteristics of an injection system are desirable in achieving these goals: • Injection pressures during the whole process should be above 1000-1200 bar for a good spray formation and air ...

Fuel Injection System - an overview | ScienceDirect Topics

Bosch fuel injectors have broad market coverage for both OE and after market applications. Fuel injector performance can be affected by particles as little as 10 microns (0.01mm). The main causes of fuel injector wear or failure is contamination of the fuel system. Corrosion due to moisture in the fuel also contributes.

The number of fuel lines on many vehicles has been reduced by "returnless" fuel injection systems. Instead of a fuel pressure regulator on the engine and a return line to send excess fuel back to the tank, these systems have a regulator mounted on the fuel pump or the Engine Control Module (ECM) controls fuel flow.

Original equipment fuel pressure regulators are pre-set to control fuel at pressure specified for a standard engine. They work fine for a grocery getter but are grossly inadequate for a modified engine with a high-flow fuel pump and injectors. We offer adjustable fuel pressure regulators that can be set to flow up to maximum fuel pump capacity.
