Let N_e be the total number of chemical substances present in the overall system at equilibrium and r be the number of reactants, then the component term C of the phase rule equation is replaced by $(N_e - r)$, i.e., $C = N_e - r$. Hence, phase

The importance of specifying the state of the inlet streams in determining the degrees of freedom (DOF) of a process is highlighted in the context of a single-stage separation unit. It is shown that, for the separation of a C-component mixture, the commonly accepted value of $2C + 6$ as the DOF of an equilibrium
