Keystone Species Predator-prey and herbivore-plant interactions help shape communities. Predation occurs when one organism (the predator) captures and eats another (the prey)

4.2 Niches and Community Interactions - DunkirkCSD

Understanding niches is important to understanding how organisms interact to form a community. Resources and the Niche The term resource can refer to any necessity of life, such as water, nutrients, light, food, or space. For plants, resources can include sunlight, water, and soil nutrients—all of which are essential to survival.

Interactions in communities (article) | Khan Academy

A species' niche is basically its ecological role, which is defined by the set of conditions, resources, and interactions it needs (or can make use of). The competitive exclusion principle says that two species can't coexist if they occupy exactly the same niche (competing for identical resources).

SAMPLE ANSWER: The global climate is shaped by many factors, including solar energy, latitude, and the transport of heat by winds and ocean currents. SAMPLE ANSWER: Some organisms are predators. Others are prey. SAMPLE ANSWER: Organisms have roles, or niches, in a community. These roles govern how organisms interact with other organisms.
