There are 3 other potential variables you could test with this simulation: amount of carbon dioxide, light intensity, and temperature. Keep the light settings at white light (you already tested colored light in the last experiment.) Choose one variable and design and experiment that would test how this factor affects the rate of photosynthesis.

Photosynthesis is also used by algae to convert solar energy into chemical energy. Oxygen is liberated as a by-product and light is considered as a major factor to complete the process of photosynthesis. Photosynthesis occurs when plants use light energy to convert carbon dioxide and water into glucose and oxygen.

Photosynthesis - Definition, Process, and Diagrams

Photosynthesis Definition. Photosynthesis is defined as the process, utilized by green plants and photosynthetic bacteria, where electromagnetic radiation is converted into chemical energy and uses light energy to convert carbon dioxide and water into carbohydrates and oxygen.

The word photosynthesis comes from two Greek words: photo, meaning "light", and synthesis, meaning "put together." Looking at that those two roots, we have a good idea of what happens during the chemical process of photosynthesis: plants put together water and carbon dioxide with light to create glucose and oxygen. In this article, we'll break down what photosynthesis is, why ...

Photosynthesis Equation: What Is It? How Does It Work?

Answer: a Explanation: Solar energy has the greatest potential of all the sources of renewable energy which comes to the earth from sun. This energy keeps the temperature of the earth above that in colder space, causes wind currents in the ocean and the atmosphere, causes water cycle and generates photosynthesis in plants.
